

Hevo Assessment

2. **README.md**

Hevo Assessment I: Data Pipeline Setup & Transformation

2.1. Project Overview

- **Goal:** Set up a CDC-based data pipeline from a local PostgreSQL source to a Snowflake destination using Hevo Data, including data transformation.
-

2.2. Prerequisites & Accounts Used

- **Hevo Account Details:**
 - **Team Name:** siddharthkakade1999@gmail.com
 - **Pipeline ID:** #7
 - **Local Postgres Setup:** Docker desktop running latest postgres image
-

2.3. Detailed Steps to Reproduce the Setup

2.3.1. Database Setup (PostgreSQL)

1. Installation:

Command ran in docker desktop:

```
docker run --name mydatabase2 -e POSTGRES_PASSWORD=admin -e POSTGRES_USER=admin -e POSTGRES_DB=mydatabase2 -p 5433:5432 -d postgres
```

2. Schema Creation:

- a. Customer table:

customer

3. Data Loading: pg4admin

4. Networking/Connectivity:

- Command to enter the docker container to run the ngrok util: `docker exec -it mydatabase /bin/bash`
- Using ngrok command: `ngrok tcp 5432`
- Further `wal_level` was set to 10
- Restart agent service and granted the permission along with whitelisting the URL

2.3.2. Hevo Pipeline Setup (Objective 5)

1. Source Configuration:

- Type: PostgreSQL
- **Ingestion Mode: Logical Replication**
- further set `wal_level = logical`

2. Destination Configuration:

- Type: Snowflake Partner Connect
 - Schema Name: `PC_HEVODATA_DB`
-

2.4. Transformation Details (Objective 6)

2.4.1. Transformation 1:

- **Goal:** To create a new table in Snowflake as order_events where each row shows as `event_type = 'order_delivered'`.
- **Method Used:** Python
- **Reference:** <https://docs.hevodata.com/pipelines/transformations/python-transfm/utils/retrieve-the-type-for-value/>
- **Code:**
 - Example

```
from io.hevo.api import Event
from io.hevo.api import Utils

def transform(event):
    properties = event.getProperties()
    order_status = properties['status']

    event_properties = {
        'order_id': properties.get('order_id')
    }
```

```

event_type = None
if order_status == 'placed':
    event_type = 'order_placed'
elif order_status == 'shipped':
    event_type = 'order_shipped'
elif order_status == 'delivered':
    event_type = 'order_delivered'
elif order_status == 'cancelled':
    event_type = 'order_cancelled'

if event_type:
    event_properties['event_type'] = event_type
    new_event = Event('order_events', event_properties)
    return [new_event]

return event

```

2.4.2. Transformation 2:

- **Goal:** Extract the text before the @ symbol from the email field as username
- **Method Used:** Python
- **Code:**
 - Sample

```

from io.hevo.api import Event
from io.hevo.api import Utils

def transform(event):
    properties = event.getProperties()

    email_field = properties.get('email')
    if isinstance(email_field, str) and '@' in email_field:

```

```
username = email_field.split('@', 1)[0]
properties['username'] = username
event.setProperties(properties)
return event
```

- **Example:** `jane.doe@gmail.com` creates an table with username `jane.doe`
-

2.5. Assumptions Made & Choices

- **status Field:** *Assumption:* The `status` field in the Postgres DDL was created as a `VARCHAR` instead of a custom Postgres `ENUM` for simplicity/wider compatibility.)
 - **Transformation Language:** Python
-

2.6. Issues, Roadblocks, & Workarounds

- The main issue **revolved around setting** up the postgres set up I'm connecting the local database to the Hevo pipeline.
- The local database was not able to connect to the Hevo pipeline and to troubleshoot this we restarted the container restarted the service configured necessary as per the support article but still there were few network issues
- Using psql found out where are the necessary file to edit as prerequisite. Configured files `postgresql.conf` and `pg_hba.conf` by searching via psql `SHOW hba_file;` and `SHOW config_file;`
- Few times the database was able to connect to the servers using ngrok but still either due to high latency or some kind of network issues the further connection was not established
 - Multiple network issue addressed during the testing
